

IPVANISH

PROTECT YOUR PRIVACY FROM END-TO-END.

IPVanish is a simple solution for taking back control of your online privacy. With our VPN apps, you can **conceal your network traffic, change your IP address, and secure your data** from unwanted onlookers.

What is a VPN, *exactly*?

A VPN (Virtual Private Network) is a tool used to make your connection on a public network a private connection. Public and untrusted Wi-Fi networks are not safe to use, but a VPN like IPVanish creates a layer of protection between your device and the internet at-large. It's easiest to picture a VPN as a secure tunnel, protecting your online traffic from interception while it travels from your device to its destination, and back again.

Everyone needs a VPN, here's why.

Privacy

Internet privacy is treated like a commodity, not the inherent right that it is.

Your broadband provider can **legally sell your online data** without your consent.

Your local law enforcement can **demand your online communications** without a warrant.

Security

Exploits and data leaks are inevitable because information passes through so many hands.

Your **device information is tracked** by websites and ad-networks alike.

Your **Wi-Fi activity is exposed** to everyone else on the network, even if it's password-protected.

Freedom

Firewalls and corporate bias enable third parties to censor access to information.

Your ISP can **interfere with your connection** to content based on their corporate interests.

Your physical **location determines the media**, apps, news, and websites you can access.

Let IPVanish protect your connection at the source.

Service Features

- Access to 40,000+ hidden IP addresses
- Network secured with advanced encryption
- Independently-audited no-traffic-logs
- No bandwidth restrictions or connection caps
- Over 2,400 servers across 90+ locations
